What are the best breakpoints to use for mobile design?

Jen Kramer

It depends. So, this is a very common question for beginners. They would like to have a formula. So, I just need to have these certain breakpoints, and I'll just write code for those. And you may start with that kind of approach. But the truth of the matter is: It depends on what your design looks like. And it depends on the types of devices you're going to anticipate that are visiting your website. Once you know that information, then you can design your breakpoints appropriately.

Just remember that you can have as many media queries as you want. You are not limited to just two or three. We often do that as we start to learn. We'll just have a handful of media queries in our code to make things a little bit simpler. But in professional-level code, you can have as many of these as you want. It won't actually affect the performance of your webpage. And you can use those to very finely tune exactly what's going to happen across different devices.

So, it just depends on your design, the meaning that you're trying to convey, and what looks beautiful. So, trust your designer instinct. You can do this.
